Charging switch relay protection

Overview

If a relay is used as a switching element, reinforced insulation between coil contact, safe separation with at least 3mm contact opening and 50k load cycle operation are prescribed (in accordance with relay standard IEC61810-1). An automatic charging relay is a type of relay used to automatically control the charging process, usually in electric vehicles or other devices that require automatic charging. This solution can replace the mechanical pre-charge contactor while improving power density. In practice, a number of relays are used within the EVSE, to connect vehicles to, or isolate vehicles from, the charger, and to ensure user safety by managing potential hazard conditions such as ground. Protective relays and devices have been developed over 100 years ago to provide “lastline”of defense for the electrical systems. They are intended to quickly identify a fault and isolate it so the balance of the system continue to run under normal conditions.
