Distance requirements for cable tray angle steel supports

Overview

Cable tray support spacing calculator Not sure how far apart to space your cable tray supports?

Use our free cable tray support spacing Cable Tray Support.

Key Takeaways

The recommended spacing for angle steel supports for cable trays is typically 4 to 6 feet for horizontal runs, with a maximum of 5 feet according to NEC guidelines.Recommended Support Intervals

For standard horizontal cable tray installations, the National Electrical Code (NEC) specifies that supports should be installed at intervals not exceeding 5 feet (1.5 meters) to safely carry the weight of the cables and any additional loads such as wind or seismic forces. Ideally, the spacing should be uniform and in the range of 4 to 6 feet (1.2 to 1.8 meters) to maintain tray stability and prevent sagging or uneven stress on the tray .

Factors Affecting Support Spacing
• Tray Type: Ladder-type, perforated, or solid-bottom trays may have slightly different requirements. Perforated trays require careful support placement to avoid deformation .

• Load Considerations: The total weight of cables, including future expansion, must be considered. Heavier loads may require closer support spacing.

• Environmental Conditions: Areas subject to vibration, wind, or seismic activity may require reduced spacing for added stability .

• Tray Material and Size: Steel, aluminum, or stainless steel trays have different strength characteristics. Larger or deeper trays may need supports closer together .
Installation Tips
• Ensure supports are level and aligned to prevent uneven stress.

• Place supports near joints or changes in direction (≤150 mm from joints) to maintain structural integrity .

• Use appropriate brackets, cantilever arms, or threaded rods depending on ceiling or wall mounting requirements . By following these guidelines, angle steel supports will provide safe, stable, and code-compliant support for cable trays in most industrial and commercial installations.
