How is the cable tray in Nauru

Overview

Cable trays are not raceways, but they are treated as a structural component of a facility''s electrical system.

Key Takeaways

Nauru's cable infrastructure, including the East Micronesia Cable landing, likely uses standard industrial cable trays such as ladder or perforated types to support and organize fiber optic and electrical cables safely.

Overview of Nauru's Cable Infrastructure

Nauru recently became part of the East Micronesia Cable System (EMCS), a 2,250 km submarine fiber optic network connecting Nauru, Kiribati, and the Federated States of Micronesia (Pohnpei and Kosrae) to improve internet connectivity . The project includes cable landing stations (CLS) at each site, which house optical transmission equipment and power feed systems. These stations require robust cable management to ensure safe routing of fiber optic and electrical cables from the beach landing points to the equipment rooms .

Cable Tray Types and Usage

Cable trays are mechanical support systems designed to organize, protect, and route cables efficiently . Common types include:

• Ladder trays: Open design with side rails and cross rungs, allowing maximum airflow and easy access for fiber and power cables. Ideal for high-capacity installations like CLS.

© 2026 ZITHA TECH SPECIALTY CABLES (Pty) Ltd - All rights reserved

• Perforated trays: Solid base with holes for ventilation, suitable for lighter cables or areas requiring some protection from debris.

• Basket trays: Wire mesh design, flexible for routing around obstacles, often used for telecommunication and fiber optic cables.

• Solid bottom trays: Provide full protection from dust and moisture, used in sensitive or indoor environments.

• Channel trays: Compact and enclosed, used for small cable runs or specific routing needs.

The choice of tray depends on cable type, weight, spacing, and environmental conditions. In Nauru, the EMCS landing likely uses ladder or perforated trays to support fiber optic cables from the beach manholes to the CLS, ensuring proper ventilation and easy maintenance .

Integration with Submarine Cable Systems

The EMCS infrastructure in Nauru includes:

• Seaward ducts and beach manholes for the submarine cable landing.

• Duct work connecting to the CLS, where cable trays organize the incoming fiber and power lines.

• Near-station backhaul to connect local operators to the main network .

These cable trays are critical for preventing cable damage, maintaining signal integrity, and allowing future expansions. Proper installation ensures that the high-capacity 100 Gbps initial provisioned channels, with potential up to 10 Tbps, operate reliably .

Conclusion

While specific models of cable trays in Nauru are not publicly detailed, the installation at the EMCS landing site likely follows international standards (IEC 61537), using ladder or perforated trays to support fiber optic and electrical cables safely and efficiently. This setup ensures robust connectivity, easy maintenance, and scalability for Nauru's growing digital infrastructure .
