How to arrange UPS cable trays

Overview

CustomFit Cable Tray: Guided Installation | UPLIFT DeskIn this video, we guide you through the installation of the UPLIFT Desk CustomFit Cable Cable manage.

Key Takeaways

Arrange UPS cable trays by separating power and control cables, ensuring proper grounding, maintaining bending radii, and selecting suitable tray types for safe and efficient cable management.Planning and Layout

Start with a careful assessment of cable requirements, including the types, quantities, and future expansion needs. Plan the tray layout to optimize routing from UPS input, output, and battery connections to distribution panels while avoiding interference with other systems and equipment . Ensure that the trays are positioned to allow easy access for maintenance and inspection.

Separation of Cables

Separate control cables (e.g., UPS communication, paralleling, and emergency power off circuits) from power cables to prevent electromagnetic interference (EMI/EMC). Place control cables in a dedicated tray, while power cables occupy a separate tray . Maintain adequate spacing between trays to reduce interference and heat buildup.

Tray Selection

Choose the appropriate tray type based on cable type and environment:

© 2026 ZITHA TECH SPECIALTY CABLES (Pty) Ltd - All rights reserved

• Ladder trays: Ideal for large power cables, provide ventilation and support for heavy conductors .

• Ventilated troughs: Suitable for smaller control and instrumentation cables, prevent sagging between rungs .

• Solid-bottom trays: Use where heat buildup is minimal or for aesthetic purposes .

• Material selection: Stainless steel or fiberglass for corrosive environments; galvanized steel for general indoor use .

Cable Installation

Use single-core flexible copper cables for power connections, ensuring the minimum bending radius is respected, especially at tray exits . For armored aluminum cables, elevate the UPS to maintain proper bending radius. Avoid overfilling trays; calculate cable fill based on cross-sectional area and load requirements to prevent overheating .

Support and Grounding

Install trays with adequate support spans to prevent sagging. Ladder trays typically require supports every 1.5–3 meters depending on load. Ensure all trays are properly grounded and bonded to the UPS earthing system, especially when multiple UPS units are used in parallel . This ensures safe operation and fault current management.

Additional Considerations

• Implement breakers or switch fuse units at UPS input and output to protect cables and connected loads .

• Maintain clear access paths for inspection and maintenance.

• Use covers for trays in high-traffic areas or where dust and debris may accumulate .

By following these steps, you can create a safe, organized, and efficient UPS cable tray system that minimizes interference, supports proper heat dissipation, and allows for future expansion.
