Latest Standards for Corrosion Protection Grades of Anti-corrosion Cable Trays

Overview

IEC 61537:2023 | IECIEC 61537:2023 specifies requirements and tests for cable tray systems and cable ladder systems intended for the support and Standards.

Key Takeaways

Corrosion protection of cable trays is governed by IEC 61537:2023 and ISO 12944, with protection grades ranging from C1 to C8/CX depending on environmental aggressiveness and coating type.Key Standards

IEC 61537:2023 specifies requirements and tests for cable tray and ladder systems, including corrosion protection considerations, and replaces the 2006 edition with updated technical guidance, including the use of trays as protective earth conductors . ISO 12944 is the international standard for corrosion protection of steel structures using paint and coating systems. It classifies environments from C1 (low corrosivity) to CX (extreme offshore conditions) and provides guidance on coating selection, application, inspection, and maintenance . This standard is widely referenced for cable trays exposed to atmospheric conditions.

Corrosion Protection Grades

Cable trays are classified according to environmental aggressiveness and required durability:

• C1–C2: Indoor or low-corrosive environments; minimal coating required, typically a single primer or light galvanization .

© 2026 ZITHA TECH SPECIALTY CABLES (Pty) Ltd - All rights reserved

• C3: Moderate industrial or coastal environments; zinc-rich primers with polyurethane topcoats, DFT 100–150 µm .

• C5–C6: Aggressive industrial or marine environments; hot-dip galvanization or high-performance coatings, DFT 120–200 µm .

• C8: Extreme corrosivity, such as coastal marine, tropical, or highly industrial areas; requires high-resistance coatings like hot-dip galvanized steel (≥120 µm), Zn-Al-Mg alloy coatings, advanced polymeric coatings (R1000+), or stainless steel (AISI 304) for maximum durability . The UNE-EN IEC 61537 standard verifies corrosion resistance through continuous salt spray tests (ISO 9227), ensuring compliance with national and international requirements .

Coating Methods and Thickness

• Hot-dip galvanization: Immersion in molten zinc forming a thick, adherent layer; preferred for harsh environments. Minimum thickness: 45–55 µm depending on component size .

• Electro-galvanization: Thin, uniform zinc layer; suitable for indoor or low-corrosive environments, less resistant than hot-dip .

• High-resistance coatings (Zn-Al-Mg or polymeric): Provide self-healing, abrasion, and chemical resistance for extreme conditions .

• Stainless steel (AISI 304): Economically viable for areas requiring maximum strength and corrosion resistance .

Practical Considerations

• Selection of coating and thickness must be validated by a specific corrosion study based on the actual environmental conditions of the project .

• ISO 12944 also incorporates maintenance timelines, allowing engineers to design systems for durability ranging from 7 years to 25+ years depending on environmental severity .

• For coastal, tropical, or industrial environments, C8 or CX-rated protection is recommended to ensure long-term performance and minimal maintenance. In summary, the latest standards for anti-corrosion cable trays integrate IEC 61537:2023 for system requirements and ISO 12944 for environmental classification and coating selection, with protection grades from C1 to C8/CX guiding the choice of material, coating type, and thickness to match environmental aggressiveness and desired service life .
