Om4 Matching Optical Module

Overview

Propel ULL Multimode OM4 MPO-08 Distribution Module, 12 duplex LC to 3X8f MPO/UPC non-pinned, Method B Enhanced. ...

Key Takeaways

OM4 fiber requires multimode optical modules that match its 50/125 µm core, typically operating at 850 nm for short-range links and supporting 10G–100G speeds.Key Considerations for Matching OM4 Modules

Fiber Type Compatibility: OM4 is a multimode fiber with a 50/125 µm core. Optical modules must be multimode and designed for 50 µm cores. OM4 modules are backward compatible with OM3 fiber, but performance will be limited to the lower-grade fiber's specifications . Wavelength Matching: Most OM4 multimode transceivers operate at 850 nm for short-range links. Some may use 1310 nm for medium-range connections. Both ends of the fiber link must use modules with the same wavelength to avoid signal loss . Speed and Duplex Mode: OM4 supports high-speed networks, including 10G, 40G, and 100G. Ensure that the transceivers at both ends support the same data rate and duplex mode (full-duplex is standard for modern links), . Connector Type: OM4 modules typically use LC or MTP/MPO connectors. The connectors on the module must match the fiber cable or use appropriate breakout modules or adapters . Interoperability: Modules from different vendors can work together if they share the same fiber type, wavelength, and speed. Using MSA-compliant modules ensures compatibility with OEM switches without affecting performance or voiding warranties .

Practical Recommendations
• For short-range 10G links, use OM4 LC duplex SFP+ modules at 850 nm.

• For 40G/100G parallel optics, use OM4 MTP/MPO transceivers with parallel fiber arrays.

• Avoid mixing OM4 with single-mode modules, as core size mismatch will cause signal degradation .

• If using OM5 fiber, OM4 modules will work but will not leverage SWDM advantages . By following these guidelines, you can ensure that your OM4 fiber network achieves optimal performance and reliability.
