Outgoing wires from motor distribution box

Key Takeaways

Outgoing wires from a motor distribution box (or MCC) must be properly sized, terminated, shielded, and routed to ensure safe and reliable motor operation.Cable Sizing and Type

The outgoing motor cables should be sized according to the current and voltage rating of the motor and the total load if multiple motors are connected . For variable frequency drives (VFDs), shielded power cables are preferred to reduce electromagnetic interference (EMI), and the insulation must be rated for the voltage and environmental conditions . Single conductors can be used, but multi-conductor shielded cables are recommended for VFD applications.

Termination Methods

Motor leads can be terminated using mechanical compression lugs (set-screw or crimp type) or split bolts . Connections using only solder or twist-on wire nuts are not acceptable. The lugs should match the number of motor leads, and bolts must be torqued to NEC-recommended values. Using Belleville washers and anti-oxidant compounds helps maintain torque and prevent oxidation, which can increase resistance and heat .

Routing and Shielding

Outgoing wires should be routed to minimize interference and avoid parallel runs with input power cables. If cables must cross, they should do so at 90° angles . For VFD-driven motors, the cable shield should be terminated at both ends to a common ground to maintain EMC compliance . Adequate spacing between cables (at least one inch) is recommended to reduce EMI.

Grounding

Proper grounding of the motor distribution box and outgoing cables is essential for personnel safety and EMC compliance . Grounding should follow local codes such as NFPA 70 (NEC) or the Canadian Electrical Code, and the shield of VFD motor cables should be connected to the ground at both the drive and motor ends .

Distribution Box Considerations

A motor distribution box, or MCC, distributes power from upstream switchgear to individual motors and may include circuit breakers, motor starters, and control transformers . Outgoing wires from the box should be connected to the motor terminals according to the motor's wiring diagram, ensuring proper phase sequence and protection devices are in place .

Summary

When wiring outgoing motor leads from a distribution box:

• Select the correct cable type and size for current, voltage, and VFD compatibility.

• Terminate using compression lugs or split bolts with proper torque and anti-oxidant treatment.

• Route cables carefully to minimize EMI and maintain separation from input lines.

• Ensure proper grounding of the box and cable shields.

• Follow local electrical codes and manufacturer recommendations for safety and reliability .
