Photovoltaic grid-connected switch protection

Overview

The grid-connected PV power system and the suggested passive anti-islanding protection are described in Section 2.

Key Takeaways

PV grid-connected switch protection ensures safe operation by isolating faults, controlling interface switches, and monitoring grid voltage and frequency.Overview of PV Protection

Grid-connected PV systems require coordinated protection on both DC and AC sides. The DC side, from PV panels to inverter input, operates at high voltage and requires protection against reverse currents, overcurrent, and arcs. The AC side, from inverter output to the grid, needs protection against overloads, short circuits, and grid disturbances . Proper protection ensures safe maintenance, compliance with standards, and minimal downtime.

DC Side Protection
• String Fuses: Protect individual PV strings from reverse current and overcurrent .

• DC Circuit Breakers: Interrupt high-voltage DC currents safely, which is challenging due to the absence of natural zero-crossing in DC circuits. Modular breakers can handle up to 6000A and voltages up to 800V .

• Surge Protective Devices (SPDs): Reduce transient overvoltage risks, especially in outdoor installations .

© 2026 ZITHA TECH SPECIALTY CABLES (Pty) Ltd - All rights reserved

• DC Disconnect Switches: Allow safe isolation of PV arrays for maintenance or emergency shutdown .
AC Side Protection
• AC Circuit Breakers: Protect the inverter output and downstream grid connection from overloads and short circuits .

• Switch-Disconnectors: Provide isolation and safe switching for AC circuits, often integrated into outdoor enclosures with IP65–IP66 protection .
Grid and System Protection

Grid and system protection (GS protection) continuously monitors grid voltage and frequency. If the grid experiences abnormal conditions or forms an islanded network, the GS protection triggers the interface switch to safely disconnect the PV system . Key points include:

• Integrated Interface Switch: Most modern inverters have an internal switch controlled by the GS protection relay. For systems up to 30 kVA, this internal protection is usually sufficient .

• External GS Protection: For larger systems (≥30 kVA and
