Should the cable tray be retested

Overview

Cable Tray Installation Rules (NEC 392) – Electrical TraderHere's what you need to know: Cable Types: Only use conductors rated for open-air environments.

Key Takeaways

Cable trays may require retesting if they are modified, damaged, or exposed to conditions that could compromise their structural or electrical integrity.When Retesting is Needed

Cable trays are initially tested for load-bearing capacity, deflection, tensile strength, corrosion resistance, and coating thickness according to standards such as IEC 61537 . Retesting is generally required in the following scenarios:

• Post-installation modifications: If the tray system is extended, rerouted, or altered, retesting ensures the new configuration meets load and safety requirements .

• Damage or wear: Any visible damage, corrosion, or deformation may necessitate a retest to verify the tray can still safely support cables .

• Environmental exposure: Trays exposed to corrosive environments, high humidity, or outdoor conditions may require periodic retesting, especially for electrical continuity and coating integrity .

• Compliance audits: Retesting may be requested during inspections to maintain certification or meet regulatory requirements .
Types of Retests
• Load-bearing test: Confirms the tray can support the rated weight without excessive sagging or permanent deformation .

• Pull/tensile test: Ensures solder joints and structural connections remain strong .

• Salt spray and coating thickness tests: Verify corrosion resistance and protective coatings remain effective .

• Electrical continuity test: Required if the tray is part of an earthing or bonding system, especially after painting, coating, or environmental exposure .
Best Practices
• Maintain test certificates and datasheets for all trays to track compliance and retesting history .

• Schedule retests after significant modifications, environmental exposure, or at intervals recommended by the manufacturer.

• Use representative samples for retesting to ensure results reflect actual working conditions . In summary, while cable trays do not require routine retesting under normal conditions, any structural changes, damage, or environmental factors that could affect performance should trigger a retest to ensure safety and compliance with IEC standards .
