Upgraded version of passive optical devices for railway communication

Overview

Coherent Optical Technologies Shaping the Evolution of Passive It evaluates the progress and limitations of IM-DD PONs, and presents the drivers for longer.

Key Takeaways

Next-generation railway optical devices, such as fgOTN-based MS-OTN platforms and fiber-optic sensors, provide higher bandwidth, lower latency, and enhanced reliability for modern rail networks.Next-Generation Optical Communication

Modern railway communication networks are evolving from traditional SDH systems to fine-grain Optical Transport Network (fgOTN) solutions, which are implemented on platforms like Huawei's MS-OTN . These upgraded devices offer:

• Bandwidth Upgrade: fgOTN supports line-side bandwidths over ten times that of SDH, with capabilities extending from 100G to 800G per wavelength, accommodating future traffic growth for 10–15 years .

• Transmission Efficiency: Smaller service granularity (10 Mbit/s steps) allows efficient transport of E1, PDH, SDH, Ethernet, MPLS-TP, and OTN services, reducing mapping layers from 3–5 to 1–3 and lowering latency .

• Enhanced O&M: Intelligent network management enables visualization of resources, link status, and one-click fault location, while maintaining SDH-like operational familiarity .

© 2026 ZITHA TECH SPECIALTY CABLES (Pty) Ltd - All rights reserved

• Clock Synchronization: Channel-associated clock adjustment ensures consistent timing without network-wide synchronization . These upgrades make passive optical devices more suitable for high-speed, high-density railway networks, supporting the transition from GSM-R to FRMCS for wireless train control.

Fiber-Optic Monitoring Systems

Upgraded optical devices also include fiber-optic sensors and measurement systems for railway infrastructure monitoring . Key features include:

• High Sensitivity and Robustness: Fiber-optic sensors detect strain, temperature, and vibration, resistant to electromagnetic interference and harsh environmental conditions.

• Autonomous Long-Term Monitoring: Capable of continuous monitoring over long distances, enabling early detection of rail misalignments, track degradation, or overhead contact system issues.

• Integration with AI: Data from optical sensors can be processed using artificial intelligence for predictive maintenance, reducing downtime and improving safety .

Ethernet and Fiber Integration

Modern railway networks also leverage fiber backhaul and Ethernet switching to replace legacy copper systems . Upgraded devices provide:

• High Reliability: DIN rail Ethernet switches and fiber backbones ensure self-healing, mission-critical connectivity for Positive Train Control (PTC) and SCADA systems.

• Multi-Interface Support: Integration of analog, serial, and Ethernet interfaces allows seamless communication between trains, wayside devices, and control centers.

• Traffic Protection: Redundant paths and direct transfer trip (DTT) mechanisms maintain service continuity even during network failures .

Summary

Upgraded passive optical devices for railway communication combine fgOTN-based high-bandwidth transmission, fiber-optic sensing, and advanced Ethernet/fiber integration. These technologies enhance network capacity, reliability, latency, and operational efficiency, while supporting predictive maintenance and future-ready wireless train control systems. They represent a significant evolution from conventional SDH and copper-based systems, enabling railways to meet the demands of digitalization and high-speed operations.

Coherent Optical Technologies Shaping the Evolution of Passive

It evaluates the progress and limitations of IM-DD PONs, and presents the drivers for longer reach and higher split coherent PONs.

Aurelis Optical LAN for Railways

Aurelis Optical LAN for railway leverages fiber optics to provide high-speed, reliable, and scalable communication networks,

Huawei Launches Industry''s First Railway Optical Communication

The application of the new fgOTN standard will accelerate the digital upgrade of the next-generation railway

MARKET UPDATE The Future of Passive Optical Networking is

Optical Access Networks (OAN) have typically been deployed using one of three different architectures: point-to-point (P2P) or point

Railway Optical Communication Solution | Huawei

A series of MS-OTN transmission equipment that supports TDM, packet, and OTN services over a metro

Key Technologies for a Beyond-100G Next-Generation Passive

In order to provide higher capacity and meet higher transmission performance requirements, it is necessary to further

Transceiver technologies for passive optical networks: past, present ...

This paper provides an overview of transceiver technologies to be used for current and next-generation passive

Light Rail, Railroads & Heavy Rail Critical Communication System ...

Our products are engineered to withstand harsh weather conditions and connect your wayside devices reliably anywhere. In this

8 Revolutionary Steps: The Evolutionary Path of PON Technology

ITU and IEEE have jointly developed a range of Passive Optical Networking (PON) standards, including APON,

Directory Data & Monitoring Premium PSU
