What is a non-enclosed cable tray

Overview

7 Types of Cable Trays: How to Choose the Right One A channel cable tray is a compact, single-piece tray system with a narrow base and raised side flanges.

Key Takeaways

A non-enclosed cable tray is an open support system for electrical or communication cables that allows easy access, ventilation, and maintenance.Definition and Design

A non-enclosed cable tray is a type of cable management system that does not fully enclose the cables within a solid cover. Instead, it provides an open structure, such as a ladder, perforated, or wire mesh design, to support and organize cables while allowing air circulation and easy access for installation, inspection, or maintenance . Common designs include:

• Ladder trays: Two side rails connected by rungs, ideal for heavy or high-voltage cables .

• Perforated trays: Solid bottom with ventilation holes, suitable for moderate cable loads .

• Wire mesh trays: Basket-like mesh, lightweight and flexible, often used for IT and data cabling .
Advantages

Non-enclosed cable trays offer several benefits:

© 2026 ZITHA TECH SPECIALTY CABLES (Pty) Ltd - All rights reserved

• Efficient heat dissipation: Open design prevents heat buildup, protecting cable insulation and extending cable life .

• Easy maintenance and upgrades: Cables can be added, removed, or rerouted without dismantling the tray .

• Flexibility: Supports various cable types and sizes, and allows multiple entry and exit points .

• Cost-effective: Generally less expensive than fully enclosed systems like conduits or trunking .
Applications

Non-enclosed cable trays are widely used in:

• Industrial environments: Factories and plants where high cable volumes and frequent access are required .

• IT and data centers: Wire mesh trays provide ventilation and easy cable management .

• Food and pharmaceutical industries: Open trays with hygiene-optimized accessories allow cleaning and prevent heat accumulation .
Materials

They are typically made from galvanized steel, aluminum, stainless steel, or fiberglass, chosen based on corrosion resistance, strength, and environmental conditions . In summary, a non-enclosed cable tray is an open, accessible, and ventilated cable support system that balances protection, flexibility, and cost, making it suitable for a wide range of industrial, commercial, and specialized applications .
