What is tdecq optical module

Overview

Understanding TDECQ: Key PAM4 Transmitter Quality Metric for TDECQ stands for Transmitter and Dispersion Eye Closure Quaternary. It is a standardized measu.

Key Takeaways

TDECQ stands for Transmitter and Dispersion Eye Closure Quaternary, a key metric that quantifies the optical quality of a PAM4 transmitter.Definition and Purpose

TDECQ is a standardized measurement used to evaluate the performance of PAM4 optical transmitters by comparing a real transmitter to an ideal reference transmitter under the same conditions . It expresses the extra optical power (in dB) required for a real transmitter to achieve the same vertical eye opening as an ideal transmitter, accounting for impairments such as noise, inter-symbol interference (ISI), and dispersion . A lower TDECQ value indicates better signal quality and typically correlates with lower bit error rates .

Why TDECQ is Important

With the shift from NRZ (two-level) to PAM4 (four-level) modulation, traditional metrics like extinction ratio and eye-mask margin became insufficient because PAM4 compresses the eye diagram into three sub-eyes. TDECQ provides a robust, repeatable metric for evaluating transmitter performance in high-speed links (50G, 100G, 200G, 400G, and beyond) and ensures link reliability and compliance with IEEE standards .

Measurement Methodology

© 2026 ZITHA TECH SPECIALTY CABLES (Pty) Ltd - All rights reserved

TDECQ measurement involves several steps:

• Signal Capture: The transmitter output is captured using a reference optical-to-electrical converter and a sampling oscilloscope .

• Reference Filtering: A 4th-order Bessel-Thomson filter simulates the bandwidth limitations of a real receiver .

• Equalization: A reference feed-forward equalizer (FFE) reopens the closed PAM4 eyes caused by the test setup, allowing accurate measurement of vertical eye closure .

• Calculation: Algorithms compute the TDECQ penalty by quantifying the vertical eye closure across all three PAM4 sub-eyes, reflecting the combined effects of noise, ISI, and dispersion .
Practical Interpretation
• 0 dB TDECQ: Perfect transmitter, identical to the ideal reference .

• IEEE Ceiling (e.g., 3.4 dB for 400G PAM4): Maximum allowable penalty for compliance .

• Lower TDECQ: Indicates better transmitter quality and more margin for real-world impairments like connector loss or temperature variations . TDECQ is critical for manufacturers and network operators because it directly correlates with symbol error rate (SER) and bit error rate (BER), ensuring that optical links operate reliably over their expected lifetime .
Summary

TDECQ is a key optical transmitter quality metric for PAM4 systems, measuring how much a real transmitter deviates from an ideal one in terms of vertical eye closure. It accounts for noise, ISI, and dispersion, and is essential for high-speed optical module compliance, link reliability, and performance evaluation in modern data center and telecom networks .
